

.NETIDS v.0.1.1.0 released

Cite as: Martin Paul Eve, ".NETIDS v.0.1.1.0 released", *eve.gd: Martin Paul Eve*, June 26, 2007, <https://doi.org/10.59348/r4g1g-6s974>.

Just a quick note to announce the release of .NETIDS v.0.1.1.0 - a small update that adds some valuable features:

- Fixed bug of empty Report.Tags object
- Added options to SecurePage to disable each type of scanning
- Updated filters

Most significantly this means that you can control whether page Output Scanning is performed from a SecurePage derived page. For those who are unaware, SecurePage is the simplest inbuilt way of scanning a page in .NETIDS. Simply inherit your page from SecurePage:

```
public partial class _Default : DOTNETIDS.SecurePage
{
}
```

and add the method

```
public override void IDSEventHandler(DOTNETIDS.Report report, DOTNETIDS.SecurePage
SecurePage)
```

This will ensure that your page is scanned in a secure-by-default fashion and also gives the option to disable each type of scan and add exclusions.

The latest package is available at the dotnetids homepage: <http://code.google.com/p/dotnetids/>
