Whilst working on the next release of .NETIDS I came across some interesting info about the parsing of numbers within JavaScript - information that is of particular relevance when it comes to filtering against `String.fromCharCode` injection attempts. The first item of interest is that JavaScript will parse hexadecimal in the form `0xYY` even when not enclosed in quotes (ie. as a string), so this can be used in `fromCharCode`.

The second interesting issue concerns the following 2 statements:

```
alert(String.fromCharCode(101));  
alert(String.fromCharCode(0101));
```

When I was writing the parser my maths engine originally assumed that `0101` was equivalent to `101`, but in JavaScript this is NOT the case. In JS, a preceding `0` indicates that the number is octal - hence the difference in outcome between the 2 statements.

The table at http://www.jibbering.com/faq/faq_notes/type_convert.html sums up JS' internal handling of number formats.
