

Expanding a treeview to a specific node in WPF

I've been exploring the dark alleyways of the Windows Presentation Foundation this week and found no way in my trawlings of the net to expand a treeview to a specific node.

No FindNode, no ExpandTo or ExpandAll. Great.

Anyway, here's the solution I came up with. It relies upon a binding the Tag property to the text you are searching for, but that could obviously be changed.

```

    /// <summary>
    /// Expand a TreeView to a specific node
    /// </summary>
    /// <param name="tv">The treeview</param>
    /// <param name="node">The string of the node in the Item.Tag property to
expand to</param>
    void jumpToFolder(TreeView tv, string node)
    {
        bool done = false;
        ItemCollection ic = tv.Items;

        while (!done)
        {
            bool found = false;

            foreach (TreeViewItem tvi in ic)
            {
                if (node.StartsWith(tvi.Tag.ToString()))
                {
                    found = true;
                    tvi.IsExpanded = true;
                    ic = tvi.Items;
                    if (node == tvi.Tag.ToString()) done = true;
                    break;
                }
            }

            done = (found == false && done == false);
        }
    }

```
