

I've gone to IPv6

Cite as: Martin Paul Eve, "I've gone to IPv6", *eve.gd: Martin Paul Eve*, January 23, 2012, <https://doi.org/10.59348/xrz0p-4p591>.

2012 has been designated [the year of IPv6 launch](#) and, to do my part, I have tweaked my infrastructure to ensure full, and future-guaranteed, IPv6 connectivity.

The following domains now support connections via IPv6:

martineve.com

pynchon.net

excursions-journal.org.uk

2bitpie.net

DNS may still be propogating, but all should be 100% within 48 hours.

In order to test this, and to enable permanent IPv6 connectivity to my home, I had to configure a 6-in-4 tunnel to my server box using OpenVPN and [the instructions at zagbot](#). A note to anybody else trying this. The instructions imply that it might work for you without the "sudo /sbin/ip -6 neigh add proxy \${BASERANGE}:\${V6NET}::2 dev eth0" line. For me, it did not. Before panicking that things aren't working, try it with that line!
