---

**T**his afternoon, after an intense day of writing, I decided that I was finally fed up with maintaining so many different copies of my publication record. I have my institutional repository, my OpenOffice CV document, my Academia.edu profile and, of course, the [version on my own site](#). I decided to do something about this.

Allow me to introduce [eprintsCV](#)! This tool will grab your eprints articles, books, conference papers and book chapters and display them in an html list.

So, for my setup here (although I now need to convert the other sections), I have setup a cron job that runs:

```
./eprintsCV.py eprints.lincoln.ac.uk 3354 "book,article,book_section,conference_item" >
some_file.html
```

I've then simply used [include html](#) to transclude the result.

Admittedly, there is risk (with a malicious eprints repository operator) for malicious insertion there, but I trust our lot.

If I had more inclination, I'd try and get this working with citeproc-py so that it could output in any format that was desired. As it stands, this is a pretty good solution for an hour-or-so's hacking.
