I spent the morning bashing my head against a brick wall, trying to sort out a problem with my Lando install. This worked on Friday, but by Monday was misbehaving. I hadn't touched the codebase, but every time I hit the primary URL, I got: "404 page not found".

I could see that my nginx server was running on <https://localhost:32840>. When I visited this, I could see that I was connecting to WordPress on nginx directly (it gave me a database connection error, because the URL wasn't recognised.) But <https://commons-wordpress.lndo.site/>, my main Lando URL, was just giving the dreaded 404 error.

This is because the main traefik proxy that Lando uses *was out of date compared to my docker version*. I had updated docker recently and the two had fallen out of sync.

The solution was frustratingly obvious and you can check if this is your problem by running:

```
docker logs -f landoproxyhyperion5000gandalfedition_proxy_1
```

If you get something like:

```
time="2025-12-01T14:22:27Z" level=error msg="Provider connection error Error response  
from daemon: client version 1.24 is too old. Minimum supported API version is 1.44,  
please upgrade your client to a newer version, retrying in 11.996919148s"  
providerName=docker
```

then you need to run:

```
lando update
```

... and that's it. Urgh.
