Another annoying error that you can get, during a docker build, that basically does not explain what's going on is something like:

Dockerfile.php:73

```
71 |     RUN mkdir -p /app/site/web && chown www-data:www-data /app/site/web
72 |     COPY --chown=www-data:www-data ./scripts /app/scripts
73 | >>> COPY --chown=www-data:www-data ./site/web/*.* /app/site/web/
74 |     COPY --chown=www-data:www-data ./plugins /app/plugins
75 |     COPY --chown=www-data:www-data ./mu-plugins /app/mu-plugins
```

```
ERROR: failed to build: failed to solve: failed to compute cache key: failed to
calculate checksum of ref 3d713212-c67a-44e0-bee9-
d62fb272cc6d::qhwfoyzlhjy0i7wvs60xthwk1: "/site/web/phpinfo.php": not found
```

This error does, actually, tell you which file it's having a problem with. See the end of the last line. Here it says that /site/web/phpinfo.php was not found. But when I look in /site/web/ there is an entry for phpinfo.php.

So what's happening?

It turns out that the problem here is a missing symbolic link. That is, the file `phpinfo.php` has been linked, but the target does not exist. So `phpinfo.php`'s symbolic link does not resolve correctly.

The solution is simply to delete such a file or to make the symbolic link resolve correctly.
